

## CLAIMS

1. (currently amended) A method for forming a semiconductor device comprising:  
~~providing a semiconductor substrate;~~  
forming an insulating layer on a surface of the a first semiconductor substrate;  
forming a first semiconductor layer comprising silicon and germanium over a  
second semiconductor substrate;  
~~providing~~ forming a strained semiconductor layer comprising silicon over the first  
semiconductor layer ~~on the insulating layer;~~  
~~defining a <100> direction of the strained semiconductor layer;~~ adhering the first  
semiconductor layer to the insulating layer;  
cleaving through the first semiconductor layer;  
removing any remaining portion of the semiconductor layer; and  
forming a transistor on the strained semiconductor layer, wherein the transistor is  
aligned along the a <100> direction of the strained semiconductor layer.
2. (original) The method of claim 1, wherein the strained semiconductor layer is in a tensile stress state.
- 3 - 6. (canceled)
7. (currently amended) A method for forming a semiconductor device comprising:  
providing a semiconductor substrate;  
~~defining a <110> direction of the semiconductor substrate;~~  
forming an insulating layer on a surface of the semiconductor substrate;  
providing an at least partially relaxed silicon-germanium layer;  
forming a silicon layer on the at least partially relaxed silicon-germanium layer  
form a pre-strained semiconductor layer.  
~~providing a pre-strained semiconductor layer;~~  
~~defining a <100> direction of the pre-strained semiconductor layer;~~

bonding ~~the a pre-strained~~ semiconductor layer to the insulating layer, wherein ~~the a <100> direction~~ of the pre-strained semiconductor layer is aligned with ~~the a <110> direction~~ of the semiconductor substrate;  
removing the at least partially relaxed silicon germanium layer; and  
forming a transistor on the pre-strained semiconductor layer, wherein the transistor is aligned along the <100> direction of the pre-strained semiconductor layer.

8. (canceled)

9. (original) The method of claim 7, wherein the semiconductor device is characterized as being a silicon-on-insulator device.

10. (original) The method of claim 7, wherein bonding of the pre-strained semiconductor layer to the insulating layer is performed by thermal wafer bonding.

11. (original) The method of claim 7, wherein forming a transistor on the pre-strained semiconductor layer comprises aligning a source/drain axis of the transistor along the <100> direction of the pre-strained semiconductor layer.

12. (original) The method of claim 7, wherein forming a transistor on the pre-strained semiconductor layer comprises aligning a source/drain axis of the transistor perpendicular to the <100> direction of the pre-strained semiconductor layer.

13 (canceled)

14. (previously presented) A method for forming a semiconductor device comprising:  
providing a semiconductor substrate;  
defining a <110> direction of the semiconductor substrate;  
forming an insulating layer on a surface of the semiconductor substrate;  
providing a pre-strained semiconductor layer on a SiGe layer;

defining a <100> direction of the pre-strained semiconductor layer;  
bonding the pre-strained semiconductor layer to the insulating layer, wherein the  
<100> of the pre-strained semiconductor layer is aligned with the <110>  
direction of the semiconductor substrate;  
cleaving the SiGe layer to leave a remaining portion of the SiGe layer on the pre-  
strained semiconductor layer; and  
removing the remaining portion of the SiGe layer after cleaving; and  
forming a transistor on the pre-strained semiconductor layer, wherein the  
transistor is aligned along the <100> direction of the pre-strained  
semiconductor layer.

15. (currently amended) A method for forming a semiconductor device comprising:  
providing a semiconductor substrate;  
~~defining a crystal orientation of the semiconductor substrate;~~  
forming an insulating layer on a surface of the semiconductor substrate;  
~~providing an at least partially relaxed silicon-germanium layer; and~~  
~~forming a silicon layer on the at least partially relaxed silicon-germanium layer to~~  
form a pre-strained semiconductor layer.  
~~providing a pre-strained semiconductor layer;~~  
~~defining a crystal orientation of the pre-strained semiconductor layer;~~  
bonding the pre-strained semiconductor layer to the insulating layer, wherein the  
crystal orientation of the pre-strained semiconductor layer is not aligned  
with the crystal orientation of the semiconductor substrate;  
~~removing the at least partially relaxed silicon-germanium layer; and~~  
forming a transistor on the pre-strained semiconductor layer, wherein a  
source/drain axis of the transistor is aligned along ~~the a~~ crystal orientation  
of the pre-strained semiconductor layer that enhances current transport  
capability of a PMOS transistor.

16. (canceled)

17. (original) The method of claim 15, wherein the semiconductor device is a silicon-on-insulator device.
18. (canceled)
19. (currently amended) The method of claim 15, wherein ~~defining a~~ the crystal orientation of the semiconductor substrate comprises ~~defining a~~ <110> direction of the semiconductor substrate.
20. (currently amended) The method of claim 15, wherein defining a the crystal orientation of the pre-strained semiconductor layer comprises ~~defining a~~ <100> direction of the pre-strained semiconductor layer.
21. (original) The method of claim 20, wherein forming a transistor on the pre-strained semiconductor layer comprises aligning a source/drain axis of the transistor along the <100> direction of the pre-strained semiconductor layer.
22. (original) The method of claim 21, wherein forming a transistor on the pre-strained semiconductor layer comprises aligning a source/drain axis of the transistor perpendicular to the <100> direction of the pre-strained semiconductor layer.
23. (canceled).
24. (currently amended) The method of claim 15, further comprising polishing the pre-strained semiconductor layer after cleaving through the at least partially relaxed silicon-germanium layer.
25. (withdrawn) A semiconductor device comprising:  
a semiconductor substrate having a first crystal orientation;  
an insulating layer formed on a surface of the semiconductor substrate; and

a pre-strained semiconductor layer bonded to the insulating layer, the pre-strained semiconductor layer having transistors formed thereon, wherein channel regions of the transistors are aligned with a second crystal orientation, the second crystal orientation being different than the first crystal orientation.

26. (withdrawn) The semiconductor device of claim 25, wherein the pre-strained semiconductor layer is in a tensile stress state.
27. (withdrawn) The semiconductor device of claim 25, wherein the pre-strained semiconductor layer is formed by depositing a silicon layer on an at least partially relaxed silicon-germanium layer.
28. (withdrawn) The semiconductor device of claim 25, wherein the second crystal orientation is along a natural cleave plane of the pre-strained semiconductor layer, and the first crystal orientation is aligned 45 degrees from the second crystal orientation.
29. (withdrawn) The semiconductor device of claim 25, wherein the second crystal orientation is rotated 45 degrees from the first crystal orientation.
30. (withdrawn) The semiconductor device of claim 25, wherein the channel regions of the transistors are aligned in a <100> direction.
31. (withdrawn) The semiconductor device of claim 25, wherein the semiconductor device is a silicon-on-insulator device.
